Power-to-weight ratio (or specific power or power-to-mass ratio) is a calculation commonly applied to engines and mobile power sources to enable the comparison of one unit or design to another. Power-to-weight ratio is a measurement of actual performance of any engine or power source. It is also used as a measurement of performance of a vehicle as a whole, with the engine's power output being ...

Charge carriers injected onto a graphene layer are perturbed by the probing microwave as rippling waves. By tracing these waves the mass and mobility of electrons can be determined experimentally in the technique referred as Field-Induced Time-Resolved Microwave Conductivity (FI-TEMC) measurement, as shown by Shu Seki and co-workers in article number 1701402.

A highly deformable and advanced 3D interlocking flexible battery is developed via a simple, one-step patterning process. The authors emphasize that the mechanical disintegration of the electrode such as through delamination, particle isolation, and crack generation were significantly mitigated, which enhances the structural and chemical stability.

Liquid chromatography–mass spectrometry (LC-MS) is an analytical chemistry technique that combines the physical separation capabilities of liquid chromatography (or HPLC) with the mass analysis capabilities of mass spectrometry (MS). Coupled chromatography - MS systems are popular in chemical analysis because the individual capabilities of each technique are enhanced synergistically.
