Thanks for the great article and for the reference to filter.pdf (my document from ages ago!). This is definitely one of the better explanations I've seen about making a Kalman filter for angle estimation based on accelerometer/gyro data.

Another reason is that a given discrete-time transfer function can be implemented in different ways, and the different implementations possibly show different behavior in various aspects, such as stability and high-frequency noise. The topic is not simple, and is beyond my competences, but the basic principle is clear.

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.

In signal processing, a filter is a device or process that removes some unwanted components or features from a signal. Filtering is a class of signal processing, the defining feature of filters being the complete or partial suppression of some aspect of the signal. Most often, this means removing some frequencies or frequency bands. However, filters do not exclusively act in the frequency domain ...

The restriction of bandwidth is twofold: to keep costs of the unit down, and that technically speaking, 192kHz codecs frequently have decimation filters with skirts well before $F_s/2$ at quad rate for the ADCs.

Bigeye tuna, *Thunnus obesus*, is an important food fish and prized recreational game fish. It is a true tuna of the genus *Thunnus*, belonging to the wider mackerel family Scombridae. In Hawaiian, it is one of two species known as ʻĀhi; the other is yellowfin tuna. Bigeye tuna are found in the open waters of all tropical and temperate oceans, but not the Mediterranean Sea

The interior of a 3-D MEMS Gyroscope Sensor is intricate and tiny (this structure is only about 0.08 cm wide). My last two blog entries discussed demonstrations of gyroscopes and angular momentum conservation at our school's science fair.

This paper presents a method to control the rotor speed of wind turbines in presence of gearbox efficiency fault. This kind of faults happens due to lack of lubrication. It affects the dynamic of the principal shaft and thus the rotor speed. The principle of the fault tolerant control is to find a bloc that equalizes the dynamics of the healthy and faulty situations.
