Classical Mechanics - Marion, Thornton | Momentum

Hooke's law is a principle of physics that states that the force (F) needed to extend or compress a spring by some distance x scales linearly with respect to that distance. That is: $F = kx$, where k is a constant factor characteristic of the spring: its stiffness, and x is small compared to the total possible deformation of the spring. The law is named after 17th-century British physicist Robert Hooke.

Hooke's law - Wikipedia

In classical mechanics, the central-force problem is to determine the motion of a particle under the influence of a single central force. A central force is a force (possibly negative) that points from the particle directly towards a fixed point in space, the center, and whose magnitude only depends on the distance of the object to the center.
